EXECUTIVE SUMMARY

This report documents the methodology employed by Sprinkle Consulting, Inc. (SCI) to evaluate the bicycling suitability, or level of service, that currently exists on the study network within Alachua County. This report also documents the data requirements, data collection and compilation guidelines, and results of the evaluation.

Overall, the existing road network in the County provides an average condition for bicycling. The roadways average a level of service “C” on a statistically calibrated grading scale of “A” through “F”. The study network includes arterial, collector, and some local roads. The figure below illustrates the distribution of the levels of service within the study network. The level of service average is a distance-weighted average (of the road segments).

The results of this evaluation can be used to produce a bicycling suitability map for distribution to the general public. The Bicycle LOS evaluation results are used in the *Alachua Countywide Bicycle Master Plan* to assist in developing a bicycle network and in the prioritization process. Other applications of the evaluation include planning, benefits comparison among proposed bikeway/road cross-sections, and estimating future bicycling

Technical Report – June 2001

conditions. It can also be used to track changes in bicycling conditions within the County's transportation network.

EVALUATION METHODOLOGY

The statistically-calibrated mathematical equation entitled the *Bicycle Level of Service¹ Model (Version 2.0)* was used as the foundation of the evaluation. This *Model* is the most accurate method of evaluating the bicycling conditions of shared roadway environments. It uses the same measurable traffic and roadway factors that transportation planners and engineers use for other travel modes. With statistical precision, the *Model* clearly reflects the effect on bicycling suitability or "compatibility" due to factors such as roadway width, bike lane widths and striping combinations, traffic volume, pavement surface conditions, motor vehicles speed and type, and on-street parking.

The *Bicycle LOS Model* is based on the proven research documented in *Transportation Research Record 1578* published by the Transportation Research Board of the National Academy of Sciences (see Appendix A). It was developed with a background of over 100,000 miles of evaluated urban, suburban, and rural roads and streets across North America. It has been adopted by the Florida Department of Transportation as the recommended standard methodology for determining existing and anticipated bicycling conditions throughout Florida. Many urbanized area planning agencies and state highway departments are using this established method of evaluating their roadway networks. These include metropolitan areas across North America such as Baltimore MD, Birmingham AL, Philadelphia PA, San Antonio TX, Houston TX, Buffalo NY, Anchorage AK, Lexington KY, and Tampa FL as well as state departments of transportation such as, Delaware Department of Transportation (DeDOT), New York State Department of Transportation (NYDOT), Maine Department of Transportation (MeDOT) and others.

¹ Landis, Bruce W. "Real-Time Human Perceptions: Toward a Bicycle Level of Service" *Transportation Research Record 1578*, Transportation Research Board, Washington DC 1997 (see Appendix A).

Technical Report – June 2001

Widespread application of the original form of the *Bicycle LOS Model* has provided several refinements. Application of the *Bicycle LOS Model* in the metropolitan area of Philadelphia resulted in the final definition of the three effective width cases for evaluating roadways with on-street parking. Application of the *Bicycle LOS Model* in the rural areas surrounding the greater Buffalo region resulted in refinements to the “low traffic volume roadway width adjustment”. A 1997 statistical enhancement to the *Model* (during statewide application in Delaware) resulted in better quantification of the effects of high-speed truck traffic [see the $SP_t(1+10.38HV)^2$ term]. As a result, *Version 2.0* has the highest correlation coefficient ($R^2 = 0.77$) of any form of the *Bicycle LOS Model*².

Version 2.0 of the *Bicycle LOS Model* was employed to evaluate the roads and streets within Alachua County. Its form is shown below:

$$\text{Bicycle LOS} = a_1 \ln(\text{Vol}_{15}/L_n) + a_2 SP_t(1+10.38HV)^2 + a_3(1/PR_5)^2 + a_4 (W_e)^2 + C$$

Where:

Vol_{15} = Volume of directional traffic in 15 minute time period

$$\text{Vol}_{15} = (\text{ADT} \times D \times K_d) / (4 \times \text{PHF})$$

where:

ADT = Average Daily Traffic on the segment or link

D = Directional Factor

K_d = Peak to Daily Factor

PHF = Peak Hour Factor

L_n = Total number of directional *through* lanes

SP_t = Effective speed limit

$$SP_t = 1.1199 \ln(SP_p - 20) + 0.8103$$

where:

SP_p = Posted speed limit (a surrogate for average running speed)

² See Appendix A for a copy of the Bicycle LOS Model's regression analysis statistics.

Technical Report – June 2001

- HV = percentage of heavy vehicles (as defined in the 1994 Highway Capacity Manual)
- PR₅ = FHWA's five point pavement surface condition rating
- W_e = Average effective width of outside through lane:

where:

$$W_e = W_v - (10 \text{ ft} \times \% \text{ OSPA}) \quad \text{and } W_l = 0$$

$$W_e = W_v + W_l (1 - 2 \times \% \text{ OSPA}) \quad \text{and } W_l > 0 \text{ \& } W_{ps} = 0$$

$$W_e = W_v + W_l - 2 (10 \times \% \text{ OSPA}) \quad \text{and } W_l > 0 \text{ \& } W_{ps} > 0 \text{ and a bikelane exists}$$

where:

- W_t = total width of outside lane (and shoulder) pavement
- OSPA = percentage of segment with occupied on-street parking
- W_l = width of paving between the outside lane stripe and the edge of pavement
- W_{ps} = width of pavement striped for on-street parking
- W_v = Effective width as a function of traffic volume

and:

$$W_v = W_t \text{ if } ADT > 4,000 \text{ veh/day}$$

$$W_v = W_t(2 - 0.00025 \times ADT) \text{ if } ADT \leq 4,000 \text{ veh/day, and if the street/road is undivided and unstriped}$$

$$a_1: 0.507 \quad a_2: 0.199 \quad a_3: 7.066 \quad a_4: -0.005 \quad C: 0.760$$

(a₁ - a₄) are coefficients established by the multi-variate regression analysis as documented in Appendix A.

Technical Report – June 2001

The *Bicycle LOS* score resulting from the final equation is stratified into service categories “A, B, C, D, E, and F” (according to the ranges shown in Table 1) to reflect users’ perception of the road segment’s level of service for bicycle travel. This stratification is in accordance with the linear scale established during the referenced research (i.e., the research project bicycle participants’ aggregate response to roadway and traffic stimuli). The *Model* is particularly responsive to the factors that are statistically significant. An example of its sensitivity to various roadway and traffic conditions is shown in Figure 1.

TABLE 1 Bicycle Level-of-Service Categories

LEVEL-OF-SERVICE	BLOS SCORE
A	≤ 1.5
B	> 1.5 and ≤ 2.5
C	> 2.5 and ≤ 3.5
D	> 3.5 and ≤ 4.5
E	> 4.5 and ≤ 5.5
F	> 5.5

Technical Report – June 2001

$$\text{Bicycle LOS} = a_1 \ln(\text{Vol}_{15}/L_n) + a_2 \text{SP}_t(1 + 10.38\text{HV})^2 + a_3(1/\text{PR}_5)^2 + a_4(W_e)^2 + C$$

$a_1: 0.507$ $a_2: 0.199$ $a_3: 7.066$ $a_4: -0.005$ $C: 0.760$

Baseline inputs:

ADT = 12,000 vpd % HV = 1 L = 2 lanes
 SP_p = 40 mph W_e = 12 ft PR₅ = 4 (good pavement)

FIGURE 1 Bicycle LOS Model Sensitivity Analysis

DATA COLLECTION AND INVENTORY GUIDELINES FOR FUTURE UPDATES

Following is the list of data required for computation of the *Bicycle LOS* scores as well as the associated guidelines for their collection and compilation into the programmed database.

Average Daily Traffic (ADT) - is the average daily traffic volume on the segment or link. The programmed database will convert these volumes to Vol_{15} using the Directional Factor (D), Peak to Daily Factor (K_d) and Peak Hour Factor (PHF) for the road segment.

Percent Heavy Vehicles(HV) - is the percentage of heavy vehicles (as defined in the 1994 *Highway Capacity Manual*).

Number of lanes of traffic (L) - Record the total number of *through* traffic lanes of the road segment and its configuration. (e.g., D = Divided, U = Undivided, OW = One Way, S = Center Turning Lane). The programmed database will convert these lanes into directional lanes. **The presence of continuous right-turn lanes should be noted in the comments field.**

Posted Speed Limit (S_p) - Record as posted.

W_t total width of pavement - is measured from the center of the road, yellow stripe, or (in the case of a multilane configuration) the lane separation striping to the edge of pavement or to the gutter pan of the curb. When there is angled parking adjacent to the outside lane, W_t is measured to the traffic-side end of the parking stall stripes.

W_{ps} width of pavement striped for on-street parking - Record this dimension only if there is parking to the right of a striped bike lane. If there is parking on two sides on a one-way, single lane street, report the combined width of the striped parking.

W_l width of paving between the outside lane stripe and the edge of pavement - is measured from the outside lane stripe to the edge of pavement or to the gutter pan of the curb. When there is angled parking adjacent to the outside lane, W_l is measured to the traffic-side end of the parking stall stripes.

OSPA % - estimate the percentage of the segment (excluding driveways) along which there is occupied on-street parking at the time of survey. Record each side separately. If the parking is allowed only during off-peak periods and parking restrictions change widths and laneage, indicate the geometric changes in the comments field. Note: Indicate any "angled parking" in the comments field.

Technical Report – June 2001

Pavement Condition:

Travel Lane (PC_T) - Evaluate the pavement condition of the motor vehicle travel lane according to the FHWA's five-point pavement surface condition rating shown in Figure 2.

Shoulder or Bike lane (PC_S) - Evaluate the pavement condition of the shoulder or bike lane according to the FHWA's five point pavement surface condition rating shown in Figure 2.

Designated Bike Lane - Indicate "Y" if there is a bikelane on the segment, otherwise enter "N".

Comments - If there is any noticeable difference in the above parameters between two directions (north/south or east/west) on a roadway segment, please record the data of the other direction in the comments field along with the direction. Report all special conditions and assumptions made during the data collection on the segment in the comments field.

RATING	PAVEMENT CONDITION
5.0 (Very Good)	Only new or nearly new pavements are likely to be smooth enough and free of cracks and patches to qualify for this category.
4.0 (Good)	Pavement, although not as smooth as described above, gives a first class ride and exhibits signs of surface deterioration
3.0 (Fair)	Riding qualities are noticeably inferior to those above; may be barely tolerable for high-speed traffic. Defects may include rutting, map cracking, and extensive patching.
2.0 (Poor)	Pavements have deteriorated to such an extent that they affect the speed of free-flow traffic. Flexible pavement has distress over 50 percent or more of the surface. Rigid pavement distress includes joint spalling, patching, etc.
1.0 (Very Poor)	Pavements that are in an extremely deteriorated condition. Distress occurs over 75 percent or more of the surface.

FIGURE 2 Pavement Condition Description

EVALUATION RESULTS

Two *Bicycle LOS* analyses were performed on the collector and arterial network as well as some local roads in Alachua County. The first analysis was done on existing conditions. The second analysis was performed on the E+C network identified from the City/County's CIP. This latter analysis was done using 2020 volumes provided by the MTPO.

Based upon the established data collection guidelines, *SCI* and agency staff collected and compiled the input data. *SCI* staff, using an Excel v.7.0 spreadsheet programmed with the *Bicycle LOS Model Ver.2.0*, then performed the two aforementioned evaluations. The resulting bicycle suitability, or level-of-service, evaluation for each segment is displayed in Table 2, "Existing Bicycling Conditions". The average level of service score for the former is "3.28"; the corresponding level of service grade is "C" on a statistically calibrated grading scale of "A" through "F", whereas the average level of service score for the latter is "3.51", with a corresponding level of service grade of "D".

The results are shown graphically on a GIS map, with the grading scale color coded in a spectrum from magenta (Bicycle LOS "E & F") to green (Bicycle LOS "A"). The Bicycle LOS evaluation results maps are at the end of this document (see Map 1 and Map 2).

The results of the Bicycle LOS evaluation are used in the development of the *Alachua Countywide Bicycle Master Plan* and the recently adopted *Gainesville Metropolitan Area 2020 Transportation Plan*. The Bicycle LOS evaluation results are used in the prioritization process and in the development of the Alachua County Bicycle Network Map. The Bicycle LOS model can be used in the future for benefits comparison among proposed bikeway/road cross-sections (see Figure 4), prioritizing and programming facility improvements, and estimating future bicycling-roadway conditions. Finally, it can also be

Technical Report – June 2001

used to track changes in bicycling conditions within the Alachua County transportation network.

This evaluation method is easily updated in the future. The electronic files will be submitted to the Client at the end of the project. Columns highlighted (in the electronic file) in red are the data input fields. As traffic and roadway conditions change (primarily only traffic volumes will change, unless road reconstruction occurs) the database or programmed spreadsheet can be updated.
